

MRI Mesh Windows

Optimum performance and appearance combined

Optical Filters emi-shielding windows for MRI rooms combine maximum visibility and good cosmetic appearance with excellent shielding effectiveness.

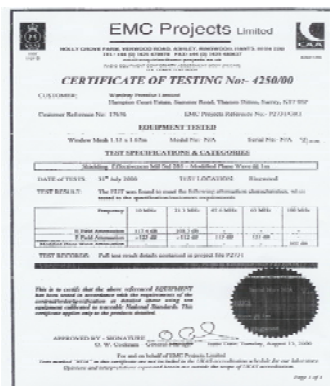

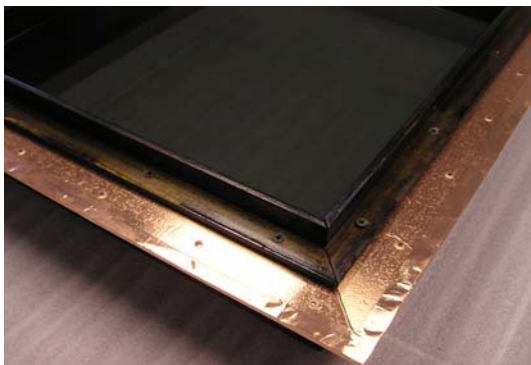

Cosmetic appearance is highly valuable for the overall aesthetics of the finished room and for a clear interface between staff and patient.

Being fully optically laminated for clarity and to prevent debris build-up within the window, Optical Filters MRI room windows offer a complete solution to cosmetic problems associated with non-laminated windows. They also have the add benefit of being maintenance free.

Installation Simplified

Optical Filters recognises that ease of installation is essential for the contractor and can supply double glazed windows already mounted in a flanged frame. The contact surface of the flange is copper under a mesh extension from the window. This gives direct contact between the mesh and wall shielding.

- **Designed to address shielding requirements of 100dB plus, Optical Filters MRI room windows are successfully proven in the field.**
